The North Carolina Violent Death Reporting System (NC-VDRS) is a CDC-funded statewide surveillance system that collects detailed information on deaths that occur in North Carolina resulting from violence: homicide, suicide, unintentional firearm deaths, legal intervention and deaths for which intent could not be determined. NC-VDRS is a multi-source system that gathers information from death certificates, medical examiner reports and law enforcement reports. The goal of this system is to aid researchers, legislators, and community interest groups in the development of public health prevention strategies to reduce violent deaths. NC-VDRS began collecting data in January 2004. This document summarizes suicide deaths that occurred during 2011-2015 among North Carolina residents who have ever served in the U.S. Armed Forces. Population data used for rate calculation are Census Estimates from the American Community Survey.

Veteran Suicide in North Carolina, 2011-2015

Veteran status was available for 98.6 percent of the 9,233 violent deaths that occurred among NC residents between 2011 and 2015.

- 1,438 (15.6%) of these deaths occurred among NC Veterans. Most veteran violent deaths were suicides (82.6%).

- The average suicide rate between 2011 and 2015 was 2.2 times higher among veterans than non-veterans (32.9 and 15.2 per 100,000, respectively).

- The suicide rate peaked for veterans ages 18 to 34 with a rate of 72.1 per 100,000, and was 5.8 times higher than the rate for non-veterans among the same age group. Veteran suicide rates were consistently higher than non-veterans across all age groups.

*Other includes fall, drowning, fire/burns, motor and other transport vehicle, and other methods of death.

- Most suicides involved a firearm for both veterans (72.8%) and non-veterans (54.3%), however there was a much larger proportion of firearms used among veteran suicides.

- The second leading cause of suicide among North Carolina veterans was hanging (13.1%) followed by poisoning (10.7%).

- Less than two percent of veteran suicides were completed using a method other than a firearm, hanging, or poisoning.
Veteran Suicide Circumstances* by Age Group:
NC-VDRS, 2011-2015
~ N.C. Division of Public Health - N.C. Violent Death Reporting System ~

- The suicides circumstances differed slightly by veteran status. More veterans had a physical health problem (32.5%) than non-veterans (18.3%).
- A smaller proportion of veterans had a history of suicide attempt(s) (9.4%), and fewer had a substance use problem other than alcohol (7.3%) compared to non-veterans (17.3%, and 17.4% respectively).
- Among the veteran suicides, circumstances differed by age group.
- More veteran's ages 18 to 34 had an intimate partner problem (43.7%) than older veterans (20.4%), and were more likely to have had a job-related problem (15.7%) than older veterans (4.8%).
- Veteran's ages 18 to 34 were less likely to have disclosed their suicide intent (26.9%), left a suicide note (27.4%), and to be currently receiving mental health treatment (35.5%) than older veterans (30.0%, 32.5%, and 42.7% respectively).
- Veteran's ages 35 and older were much more likely to have had a physical health problem (38.8%) than veterans ages 18 to 34 (4.1%).

* Among those with reported circumstance information. 92.2% of veteran cases had circumstance information. 31 veterans ages 18-34 and 62 veterans ages 35 and older were missing circumstance information.
