ELDER SUICIDE IN NORTH CAROLINA, 2010-2014

The North Carolina Violent Death Reporting System (NC-VDRS) is a CDC-funded statewide surveillance system that collects detailed information on deaths that occur in North Carolina resulting from violence: homicide, suicide, unintentional firearm deaths, legal intervention and deaths for which intent could not be determined. NC-VDRS is a multi-source system that gathers information from death certificates, medical examiner reports and law enforcement reports. The goal of this system is to aid researchers, legislators, and community interest groups in the development of public health prevention strategies to reduce violent deaths. NC-VDRS began collecting data in January 2004. This document summarizes deaths among North Carolina residents ages 65 and older completing suicide for the years 2010-2014.

From 2010 to 2014, 1,290 North Carolina residents ages 65 and older died as a result of violence. Of these violent deaths, 1,057 were suicide (81.9%).

The elder suicide rate was 15.7 suicides per 100,000.

Eighty-three percent of elder suicides were among males.

The suicide rate peaked among males 85 and older, and the suicide rate was consistently higher for males compared to females for all age groups.

Among females, the suicide rate peaked among those ages 65-74.

Ninety-four percent of elder suicide victims were identified as non-Hispanic (NH) white. The remaining six percent were identified as NH black, NH Asian, NH American Indian, or Hispanic.

Overall, the most common method of suicide among elder suicide victims was firearms (81.2%), followed by poisoning (10.3%) and hanging/strangulation/suffocation (6.1%).

Two percent of suicides were completed using a method other than firearms, poisoning or hanging.

*Other methods include: sharp instrument, fire/burns, motor vehicle and other.
Elder Suicide Circumstances*: NC-VDRS, 2010-2014

*Circumstances are known for 94% males (n=822) and 96% females (n=171).

- Nearly half (38.9%) of elder male suicide victims with circumstance information were characterized as having a current depressed mood at the time of death compared to 33.9 percent of females.

- Sixty-two percent of elder female and 40.5 percent of elder male suicide victims had a current mental health problem when they completed suicide.

- Twenty percent of elder females had a history of prior suicide attempts, whereas only 5.7 percent of elder males had a history of prior suicide attempts.

- Fifty-six percent of males and 37.4 percent of females had a physical health problem.
