VIOLENT DEATH IN NORTH CAROLINA:
NEW HANOVER COUNTY INCIDENTS, 2005-2014

The North Carolina Violent Death Reporting System (NC-VDRS) is a CDC-funded statewide surveillance system that collects detailed information on deaths that occur in North Carolina resulting from violence: homicide, suicide, unintentional firearm deaths, legal intervention and deaths for which intent could not be determined. NC-VDRS is a multi-source system that gathers information from death certificates, medical examiner reports and law enforcement reports. The goal of this system is to aid researchers, legislators, and community interest groups in the development of public health prevention strategies to reduce violent deaths. All deaths reported in this document are based on location of occurrence rather than residence and, instead of a rate, the occurrent ratio is reported. This statistic is derived from the total number of violent deaths resulting from injuries in a specified geographic region divided by the number of residents in this region. This document summarizes all fatal injuries from violence that occurred in New Hanover County for the years 2005-2014.

• For the years 2005-2014, there were 458 violent deaths from injuries sustained in New Hanover County. Of these 458 deaths, 449 were N.C. residents (98.0%) and 409 were New Hanover County residents (89.3%).

• There were 302 suicides (65.9%), 114 homicides (24.9%), zero unintentional firearm death (0.0%), nine deaths from legal intervention (2.0%) and 33 deaths of undetermined intent (7.2%).

*S. C. Division of Public Health - N.C. Violent Death Reporting System*

- Homicide 25%
- Suicide 66%
- Legal Intervention 2%
- Undetermined Intent 7%

*Based on the county of injury occurrence.

• In New Hanover County, the suicide ratio was 2.9 times higher in males than females, and the homicide ratio was 4.0 times higher in males than in females.

• Patterns of suicide and homicide differed by race. Suicide victims were more likely to be non-Hispanic (NH) White than NH Black. NH Whites had 20.2 suicides per 100,000 population versus 5.4 suicides per 100,000 population in NH Blacks. All other racial groups combined had four suicides.

• In contrast, NH Blacks had 23.4 homicides per 100,000 population as opposed to NH Whites who had 2.6 homicides per 100,000 population. All other racial groups combined had one homicide.

*Based on the county of injury occurrence.

* Rates based on less than 10 deaths are considered unstable and should not be used. Rates based on less than 5 deaths are too small to support the calculation of a rate.

* Other race refers to Hispanics, American Indians, Asians, other races, and unspecified or unknown race.
Suicides and homicides displayed dissimilar age patterns. Homicides peaked among those 20-24 with 13.5 homicides per 100,000, where suicides peaked among those 45-54 with 26.7 suicides per 100,000.

Most homicides (65.8%) and nearly half of suicides (45.0%) were committed using firearms.

Suspicion of intoxication was reported in 28.1 percent of homicides and 30.1 percent of suicides.

For homicide incidents where one or more suspects were identified, the relationship of the victim to the suspect was known (current or former spouse/boyfriend/girlfriend, family, friend or acquaintance) more frequently for male (73.8%) than female (66.7%) victims.

The North Carolina Violent Death Reporting System is supported by Cooperative Agreement 5U17/CE002613-03 from the Centers for Disease Control and Prevention (CDC).
